

## ABSTRACT OF THE INVENTION

Consent management between a client and a network server. In response to a request for consent, a central server determines if requested user information is included in a user profile associated with a user and if the user has granted consent to share the requested user information. A user interface is provided to the user via a browser of the client to collect the requested user information that is not included in the user profile and the consent to share the requested user information from the user. After receiving the user information provided by the user via the user interface, the service provided by the network server is allowed access to the received user information, and the central server updates the user profile. Other aspects of the invention are directed to computer-readable media for use with profile and consent accrual.
